* The syllabi of the courses starting with Course Code No. 4XX are available in IPhD Course Curriculum. The syllabi for Courses with Code No. 6XX will include the syllabi of Courses with Code No. 4XX plus additional special/advanced topics that will be decided by the concerned teachers.

Biswajit Chakraborty  
Professor & Dean (Academic Programme)  
S N Bose National Centre for Basic Sciences
COURSE DESCRIPTION IN OUTLINE

Fifth Semester Syllabus

PHY 501 RESEARCH METHODOLOGY: 4-0-0-4

1. Define Research and Methodology; Types of research methods available; Describe Experiments, Theory and Computation/Simulation in general terms; Spell out explicitly (with a few examples) the connection among them.

2. Define Library Research, Field Research and Laboratory Research; Explain Sample Survey, Sample Collection and/or Preparation, Data Analyses, Hypothesis, Modeling, Interpretation, and Conclusion.

4. Accuracy and Precision in Measurements/Predictions. Selectivity and Specificity of a Method Developed; Generalization and External Validity; Internal Validity and Inter-relationship between measurements and the underlying theory/hypothesis.

5. Formulation of a Research Problem: Motivation, Induction, Hypothesis, Deduction, Observation and Conclusion

6. Scientific Reporting of Data/Observation/Prediction; Difference between Magazine or Newspaper Reporting, and Science Journal Reporting; Expression Skill Development and Nurturing.

9. Specific Experimental, Theoretical and Simulation Techniques for Decoding the Systems Around; Interconnection Between Theory and Experiments. Computer Languages Necessary for Machining a Scientific Problem, and Relevant Data Collection; Examples of a few commercially available software; Popular Numerical Techniques and Libraries (For example, MATLAB).

**PHY 502 REVIEW OF THE TOPICAL RESEARCH: 4-0-0-4**

Goal of the review – History of the subject – development of the subject: theoretical and experimental – alternative models and theories – pros and cons of various models and theories if any – the relevance of the topical research from the perspective of the subject – Possible ways to develop the research topic further.

**PHY 503 CONDENSED MATTER PHYSICS: 4-0-0-4**

- Crystal Structure, X-ray Diffraction, Reciprocal Lattice.
- Periodic potentials, Bloch’s Theorem, Kroning Penney Model, Free electrons and nearly free electrons; tight binding approximation.
- Elementary ideas of band structure of crystalline solids.
- Concept of holes and effective mass; density of states; Fermi surface; explanation of electronic behaviour of metals, semi-conductors and insulators.
- Lattice vibrations, harmonic approximation, dispersion relations and normal modes, quantization of lattice vibrations and phonons. thermal expansion and need for anharmonicity.
- Superconductivity: Phenomenology, penetration depth, flux quantization etc. Josephson effect.
- Semiconductors: intrinsic and extrinsic, carrier mobility etc.
- Thermal properties of solids.
- Magnetism in solids.
- Optical and Dielectric Properties.

*Dekker, Solid State Physics
Kittel, Introduction to Solid State Physics
Ashcroft and Mermin, Introduction to Solid State Physics.
Ziman, Principles of the Theory of Solids.*

**PHY 504 COMPUTATIONAL METHODS IN PHYSICS: 3-1-0-4**
Introduction to Fortran programming and basic numerical methods will be imparted to the students through lectures and projects based on the numerical analysis of elementary physical problems illustrating such techniques. This course will involve lectures on advanced numerical techniques and projects based on the numerical analysis of advanced physical problems illustrating such techniques.

**PHY 505 CLASSICAL MECHANICS & ELECTROMAGNETISM: 4-0-0-4**

Lagrangian treatment, Variational principle, Hamiltonian structure, Canonical transformations, Hamilton Jacobi theory, Spatial relativity, Electromagnetism from a least action principle, potential theory, retarded and advanced potentials, waves.

*H. Goldstein, Classical Mechanics
J. D Jackson, Electrodynamics*

**PHY 506 QUANTUM PHYSICS (FORMAL): 4-0-0-4**

The formal structure of quantum mechanics, Schroedinger equation, matrix formulations, application to simple systems, angular momentum, perturbation theory, variational techniques, and WKB approximations.

*R. Shankar, Quantum Mechanics
L.D Landau and E. M Lifshitz, Course of Theoretical Physics*

**PHY 507 MATHEMATICAL METHODS – I: 3-1-0-4**

- Vector analysis, Green, Gauss and Stokes theorems.
- Linear vector spaces and linear operators. Matrices & eigenvalue problem.
- Theory of complex variables, Cauchy-Riemann conditions, Cauchy integral theorem, Taylor- Laurent expansion, classification of singularities, analytic continuation, theorem of residues and evaluation of definite integrals and series.
- Ordinary differential equations and series solution. Sturm-Liouville problem and orthogonal functions, special functions.
- Green’s functions for self-adjoint differential operators and eigenfunction expansion. (Laplace, Poisson, Diffusion, Wave equation etc to be discussed).

In addition to the above, some lectures at a more advanced level will be offered.

*G. Arfken, Mathematical Methods for Physicists
I.N. Sneddon, Special Functions of Mathematical Physics & Chemistry
P.K. Chattopadhyay, Mathematical Physics
E. Kreyszig, Advanced Engineering Mathematics
Mathews and Walker, Mathematical Physics
P. Dennery & A. Krzywicki, Mathematics for Physicists
C.M. Bender & S.A. Orszag, Advanced Mathematical Methods for Scientists & Engineers
E. Butkov, Mathematical Physics*
PHY 508 NUMERICAL METHODS: 3-1-0-4

In addition to the above, some lectures at a more advanced level will be offered.
1. Programming in FORTRAN by Rajaraman.
2. Numerical Recipe by Press, Shapiro and Teukolski
3. Numerical methods for Scientists and Engineers by HM Antia

PHY 509 RELATIVITY & COSMOLOGY: 4-0-0-4

The Equivalence Principle: Non-Inertial frames and non-Euclidean Geometry, General Coordinate transformations and the general covariance of physical laws.

Simple Solutions and Singularities: Static, Spherically symmetric space-time, Schwarzschild’s exterior solution, Motion of perihelion of Mercury, Bending of Light, Gravitational Red-Shift Radar Echo delay.

Cosmology: Important models of the Universe; Red shift and expansion; Bigbang theory, Early Universe, and decoupling, neutrino temperature, nucleosynthesis, relative abundances of hydrogen, helium, deuterium, Radiation and matter dominated phases, Cosmic microwave background radiation, its isotropy and anisotropy properties, COBE and WMAP experiments; CMBR anisotropy as a hint to a large scale structure formation.

Dark Matter and Dark energy: need for them and possible models.
1. Relativity: special, general, and cosmological, W. Rindler
2. General Theory of Relativity: Robert Wald
3. Gravitation and cosmology: principles and applications of the general theory of relativity, S. Weinberg
4. Relevant reviews from current journals as reading matter

PHY 510 ASTROPHYSICS: 4-0-0-4
Basic Background and Instrumentations: Elementary radiative transfer equations, absorption and emission, atomic processes, continuum and line emission, Optical and radio telescopes, Fourier Transform methods, detectors and image processing, Distance measurements in astronomy, Hubble’s law, modern observational techniques.

Spectral Classifications of Stars: Saha’s equation, Harvard system, Luminosity effect, Absolute and apparent luminosity relation, spectroscopic parallax

Evolution of Stars: Observational basis, protostars, disks, bipolar outflows, hydrostatic equilibrium, Sources of stellar energy, Gravitational Collapse, Fusion reactions (p-p) chain, CNO Cycle, triple alpha reactions, formation of heavy elements, Hertzsprung-Russell diagram, evolution of lowmass and high mass stars, Chandrasekhar limit, Pulsars, neutron stars and black holes

The Sun: Different layers of the Sun and their properties, Solar cycles, sunspots, solar corona and solar winds, expected and observed solar neutrino spectra, Possible resolution of the solar neutrino problem.

Binary Stars: Different types of binary stars, Importance of binary systems, Accretion, spectral properties of radiations from accretion flows and identification of black holes and neutron stars.

Galaxies: Formations and classification, Density Wave Theory of the formation of spiral arms, Rotation curves, missing mass and dark matter, Quasars and active galactic nuclei magnetic fields in the galaxy.

Cosmic Rays: Extensive air shower and Fermi’s theory of high energy cosmic rays; Interaction of high energy cosmic rays with the CMBR background and the GZK cutoff, Cosmic ray experiments like HiRes, AGASA, Pierre Augur Observatory.

PHY 511 HIGH ENERGY ASTROPHYSICS AROUND COMPACT STARS: 4-0-0-4

Astrophysics of compact stars: Black Holes, Neutron Stars and White Dwarfs; Accretion processes on these objects: Transonic Flows, Outflows and origin, acceleration and collimation of jets; Radiative Properties of the accretion flows; Observational Evidence for compact stars.

Data Analysis: Observations of high energy radiation from compact objects; satellite data and their analysis

1. Accretion Power in Astrophysics - J. Frank
3. Accretion Processes in Astrophysics – (Physics Reports) S.K. Chakrabarti

PHY 591 PROJECT RESEARCH – PART I
Projects shall be taken up by students under the supervision of a Research Guide.

**Sixth Semester Syllabus**

**PHY 601 ADVANCED CONDENSED MATTER PHYSICS – MAGNETISM & SUPERCONDUCTIVITY: 4-0-0-4**

Generalized Hamiltonian of Condensed Matter Physics and origin of various "effective theories"; Introduction to phenomenon of Superconductivity; Experimental features; Various phenomenological theories; Cooper's one pair problem; Gateway to microscopic theories---BCS Fermion pairing theory and BSB Bose Condensation theory; BCS ground state; Mean field treatment of BCS Hamiltonian; Gap equation and its solution; Equation for critical temperature; Brief applications of BCS theory to various experiments; Brief introduction to exotic phenomena like interplay of superconductivity and magnetism, high temperature superconductivity etc.

In addition to the above, some lectures at a more advanced level will be offered.

(i) "Theory of Superconductivity" by J.R. Schrieffer.
(ii) "Solid State Physics" by N. Ashcroft and N.D. Mermin.
(iii) "Introduction to Solid State Physics" by C. Kittel.
(iv) "Quantum Theory of Solids" by C. Kittel.
(v) "Quantum Theory of Many Particle Systems" by G.D. Mahan.
(vi) "Elementary Excitations" by D. Pines

**PHY 602 ADVANCED CONDENSED MATTER PHYSICS – ELECTRONIC STRUCTURE & PHYSICS OF MATERIALS: 4-0-0-4**

- **Physics of Materials:**
  - Metals (M) and Insulators (I)
  - **A. BAND INSULATORS vs CORRELATED INSULATORS**
  - Breakdown of independent electron description
  - Mott transition
  - Hubbard model
  - Limiting cases of Hubbard models - band limit & atomic limit, Hubbard sub-bands
  - Mott transitions in transition metal oxides
  - Mott insulators & charge transfer insulator, Zaanen-Sawatzky-Allen classification
  - **B. LARGE-U LIMIT**
  - Canonical transformation
  - t-J model, Super-exchange
  - Half-filled band : Heisenberg spin model
  - Antiferromagnetic Heisenberg model : spin waves, strange world of D=1
  - **C. SOME INTERESTING SYSTEMS**
  - Band-width-control M-I transition systems: V2O3, RNiO3, NiS etc
  - Filling control M-I transition systems: R_{1-x}A_{x}Ti(V)O3
  - High Tc super-conducting cuprates
  - Quasi one-dimensional systems: Cu-O chain & ladder compounds
  - Double-exchange systems: R_{1-x}A_{x}MnO3
D. DISORDER INDUCED INSULATORS
   - Anderson Localization
   - Scaling theory
   - Electron-electron interaction & disorder

References:
4. Fulde -- Electron correlation in Molecules and Solids

- Electronic Structure of Materials

A. BASICS
   1. Electrons in periodic potentials
      - Bloch's theorem
      - Kronig-Penney model
      - concept of energy bands

   2. Density of states
      - Green's function
      - Tridiagonal matrices & Continued fractions
      - Singularities in DOS

   3. Reciprocal lattice & Brillouin zone
      - Special k-points in BZ sampling

B. EL-ION PROBLEM
   4. Adiabatic approximation (Born-Oppenheimer).
   5. Classical nuclei approximation (Ehrenfest Theorem).
   6. Hellman-Feynman force on nuclei.

C. MANY-ELECTRON PROBLEM
   7. Hartree approximation
      - LCAO method
   8. Hartree-Fock approx.
      - Slater-determinantal wavefunction & its properties
      - Hartree-Fock equation
      - Fock operator
      - Energy of the groundstate
      - Koopman's theorem
   9. Going beyond Hartree-Fock (introductory)
      - absence of correlation in H-F theory
      - Basics of MCI and Perturbative (Moller-Plesset) methods
  10. Density Functional Theory
      - Energy as a functional of density : basic concepts
      - Thomas-Fermi theory
      - Hohenberg-Kohn Theorem
      - Kohn-Sham Eqn.
      - LDA for the exchange-correlation function

D. MOLECULAR DYNAMICS METHODS IN ELECTRONIC STRUCTURE
  11. Introduction to MD methods
      - Deterministic vs. Stochastic methods
      - Connection to statistical mechanics & thermodynamics
- Finite difference algorithms for solving eqns. of motion
- running and controlling MD simulations
- Limitations & errors in MD simulation

12. Tight-binding MD
- Eqn of motion in TB-MD

13. Ab-initio (Car-Parrinello) MD
- Basic concepts and effective Lagrangian
- Eqn of motion
- Iterative solution of Kohn-Sham eqn

E. EXPERIMENTAL MANIFESTATION OF ELECTRONIC STRUCTURE
- Theory of photoemission
- Core-levels and Final states
- Satellites
- Valence band
- Band structure
- Surface states and surface effects

1. Ashcroft & Mermin -- Solid State Physics
2. Grosso & Pastore-Parravicini -- Solid State Theory
3. Kaxiras -- Electronic Structure of Solids
4. Sutton -- Electronic Structure of Materials
5. Fulde -- Electron correlation in Molecules and Solids

PHY 603 STATISTICAL PHYSICS: 3-1-0-4
Foundations, micro-canonical, canonical and grand canonical ensembles, non-interacting systems, interacting systems, phase transitions, quantum statistics, BEC, Quantum Hall, magnetism, superconductivity.

PHY 604 QUANTUM PHYSICS (APPLICATION): 3-1-0-4
Applications of quantum mechanics to atomic physics, condensed matter physics and nuclear physics.

PHY 691 PROJECT RESEARCH – PART II
Continuation of the fifth semester project under the supervision of a Research Guide.

BISWAJIT CHAKRABORTY
PROFESSOR & DEAN (ACADEMIC PROGRAMME)
S N BOSE NATIONAL CENTRE FOR BASIC SCIENCES
Ph.D. PROGRAMME IN CHEMICAL SCIENCES

DEPARTMENT OF CHEMICAL, BIOLOGICAL & MACROMOLECULAR SCIENCE (CBMS)

COURSE STRUCTURE & SYLLABUS

The current syllabus and the course structure aim at training students in different areas of frontier research leading to Ph.D. degrees keeping in mind the different academic backgrounds of the students. With this end in view the CBMS Department, SNBNCBS includes the detailed Syllabus prepared and approved in 2005 for training the Post B.Sc. Integrated Ph.D. students in Chemical Sciences. In addition to this, a few more advanced courses have been included. Every semester from this syllabus, the Departmental Faculty Committee shall announce the Courses typically suitable to the new intake of students.

[Semester I & II – Fall (August – December) & Spring (January – May)]

[L – Lecture; T – Tutorial; P – Practical; C - Credit]

Fifth Semester Syllabus

COURSE DESCRIPTION IN OUTLINE

CB 521: NUMERICAL METHODS

Reference Books:
1. Programming in FORTRAN by Rajaraman.

CB 522: CONDENSED MATTER THEORY
Drude’s model, Sommerfeld’s theory of free electrons, entropy calculation, Electron in a periodic potential, Bloch’s theorem, Almost free electron approximation, Tight binding approximation, group velocity of an electron in a periodic potential, effective mass tensor, reciprocal lattice, density of states as a surface Integral.

Reference Books:
1. Solid state physics by Ashcroft-Mermin
2. Theory of properties of metals and alloys by Mott and Jones.

CB 523: ADVANCED EQUILIBRIUM STATISTICAL MECHANICS
2. Structural quantities of a liquid, Single point density, Pair correlation function.  
Structure factor.  
Thermodynamics of a liquid in terms of pair correlation function.
3. Mean Field Theory in Variational approach.  
4. Grand partition function of a liquid as a function of external potential. Direct correlation  
function. Classical density functional theory. Application to freezing and screening in  
colloids.
5. Basic algorithm of Monte Carlo, Molecular Dynamics and Brownian Dynamics  
Simulation.

Reference Books:  
2. Theory of Simple Liquids by Hansen and McDonald  
3. Complete Simulation of Liquids by Allen & Tildesley

CB 524: PHYSICAL CHEMISTRY: EXPERIMENTS & THEORY  
1. Rate & Order of Reaction, Determination of Rate Equation, Various types of first order  
reaction, Principles of Microscopic Reversibility and Detailed Balance, Flow Reactors,  
Effect of Temperature, Mechanism of Chemical Reactions, Relation between rate  
constants for the forward and backward reactions, molecularity of a reaction (uni, bi &  
tri), Unbranched & Branched Chain reaction, Analyses of Complex Reaction Systems and  
Solution of Coupled Linear Rate Equations.
Calculations of a Rate Constant, Transition State Theory, Hinselwood’s modification,  
Rice-Ramsperger-Kassel-Marcus Theory (a small touch) Thermodynamic Formulation of  
TST, Molecular Beam Experiments, Principles of Photochemistry, Rates of  
Intramolecular Processes, Quenching, Intermolecular processes, Chemical Reactions and  
their Quantum Yields, Flash Photolysis, Femtosecond Transition State Spectroscopy,  
Small discussions on Photosynthesis and Photochemical Cell.
3. Kinetics in the Liquid Phase: Small discussion on Liquid Structure including radial  
distribution function and structure factor, Viscosity of a Liquid, Diffusion, Mobility of an  
Ion, Encounter Pairs, Diffusion Controlled Reactions in Liquids, Relaxation Time for a  
one step reaction, Rate constants for elementary reactions in water, Acid and Base  
Catalysis, Kinetic Salt effect, Enzyme Catalysis (Michaelis-Menten Kinetics), Stern-  
4. Relation Between Diffusion and Brownian Motion, Thermodynamic view of diffusion,  
diffusion equation, diffusion probabilities, Statistical view of diffusion, Random walk,  
Einstein-Smoluchowski equation, Ion conductivities and ion-ion interaction, expression  
for diffusion in terms of force autocorrelation and velocity auto-correlation functions.
5. Kramers’ theory for simple chemical reaction in liquid, energy and diffusion dominated  
regimes, viscosity (friction dependence); Breakdown of Kramers’ theory as revealed by  
time domain laser spectroscopy, fractional viscosity dependence of cis-trans  
isomerization of stilbene. Grote-Hynes Theory for the observed fractional viscosity  
dependence and the related debate.
6. Solvation as an example of non-reactive dynamics, time scales for solvation in simple liquids and dynamical solvent control on reaction rates. Factors that determine the fast response and its coupling to the environment, time scales found in trapped solvents and solvents (water) near macromolecular surfaces; Supercritical solvents and its difference (structure & dynamics) with solvents at ambient condition, solvation in ionic liquids.

7. Atoms and Molecules in Intense and Super-intense laser fields

References and Books:

5. R. A. Alberty and R. J. Silbey, Physical Chemistry. John Wiley and Sons

CB 525: INSTRUMENTAL METHODS OF ANALYSIS

Reference Books:

1. Electronic Principles by Malvino
2. Instrumental Methods of Analysis by Willard, Merritt, Dean, Settle
3. Principles of Fluorescence Spectroscopy by J. Lakowicz
4. Time correlated single photon counting O’conor and Philips
5. PhD thesis from Dr. Pal’s Group

CB 526: FUNDAMENTALS OF BIOPHYSICS
Biological Macromolecules (Structure Protein and Nucleic Acids), Spectroscopic Methods to study Biological Macromolecules (UV-VIS, Fluorescence, Circular Dichroism, NMR), Protein folding and application of FRET to protein folding, Enzymes: Reaction kinetics, mechanism and inhibition and measurement methodologies, Gene structure, modification, DNA damage and Cancer Biology, Receptor-ligand interactions and Signal transduction, Solvation, densimetric, sonometric methods to study biomolecular interaction, Fluorescence anisotropy to study microenvironments and charge transfer reactions in biological macromolecules.

Reference Books:
1. *Biochemistry* by Donald Voet and Judith G. Voet
2. *Protein Structure and Function* by George A. Petsko
3. *Principles of Fluorescence Spectroscopy* by J. Lakowicz

CB 527: MOLECULAR PHYSICS AND SPECTROSCOPY

Born-Oppenheimer approximation; Franck-Condon factor, diabatic and adiabatic representation; nonadiabatic effects.
Potential energy surface; vibration and rotational motion on an electronic energy surface.
Valence bond and molecular orbital theory.

Radiation-matter interaction; interaction of a two-level system with a single mode classical and quantum field; Calculation of absorption, fluorescence and Raman spectra of multimode two-state molecular system.
Electron transfer and energy transfer in molecular system.

Reference Books:
1. Nitzan, *Chemical Dynamics*
2. Szabo and Oslund, *Quantum Chemistry*
3. May and Kuhn, *Energy transfer and electron transfer*
4. Louisell, *Quantum Statistical Properties of Radiation*
5. Mukamel, *Principles of nonlinear spectroscopy*

CB 528: STOCHASTIC PROCESSES IN PHYSICS AND CHEMISTRY

Brownian motion; introduction to probability theory; Gaussian distribution; Central limit theorem; Onsager regression theorem; linear response theory; fluctuation-dissipation relations and spectra; Langevin equation, Master equation, Fokker-Planck and Smoluchowski approaches to dynamical processes and their solutions for simple problems.

Introduction to chemical reaction kinetics, order of a reaction with examples; Microscopic theories of chemical reaction rates: Collision theory; transition state theory; Kramers theory; effect of diffusion in unimolecular reaction rate.

Reference Books:
1. David Chandler, *Nonequilibrium systems*
2. Van Kampen, *Stochastic Processes*
3. Zwanzig, *Nonequilibrium phenomena*
4. Nitzan, *Chemical dynamics*

CB 529: DYNAMICS NEAR AND FAR AWAY FROM EQUILIBRIUM SYSTEMS

Brownian motion; introduction to probability theory; Gaussian distribution; Central limit theorem; Onsager regression theorem; linear response theory; fluctuation-dissipation
relations and spectra; Langevin equation, Master equation, Fokker-Planck and Smoluchowski approaches to dynamical processes and their solutions for simple problems. Oscillatory chemical reactions and population dynamics in simple system; An introduction to nonlinear dynamics; nonlinear feedback systems and nonequilibrium steady state; reaction-diffusion systems; Pattern formation in nonlinear dynamical system with simple diffusion.

Reference Books:

1. McQuarrie, Nonequilibrium systems
2. R. Zwanzig, Nonequilibrium phenomena
3. Nitzan, Chemical dynamics
4. Epstein, Nonlinear dynamics and chaos in chemical systems
5. van Kampen, Stochastic Processes

CB 530: MATHEMATICAL METHODS

- Vector analysis, Green, Gauss and Stokes theorems.
- Linear vector spaces and linear operators. Matrices & eigenvalue problem.
- Theory of complex variables, Cauchy-Riemann conditions, Cauchy integral theorems, Taylor-Laurent expansion, classification of singularities, analytic continuation, theorem of residues and evaluation of definite integrals and series.
- Ordinary differential equations and series solution. Sturm-Liouville problem and orthogonal functions, special functions.
- Green’s functions for self-adjoint differential operators and eigenfunction expansion. (Laplace, Poisson, Diffusion, Wave equation etc to be discussed).

References & Books:

C.M. Bender & S.A. Orszag, Advanced Mathematical Methods for Scientists & Engineers
E. Butkov, Mathematical Physics
R.W. Churchill & J.W. Brown, Complex Variables & Applications

CB 532: CHEMICAL DYNAMICS

2. Kinetics in the Liquid Phase: Small discussion on Liquid Structure including radial distribution function and structure factor, Viscosity of a Liquid, Diffusion, Mobility of an Ion, Encounter Pairs, Diffusion Controlled Reactions in Liquids, Relaxation Time for a one step reaction, Rate constants for elementary reactions in water, Acid and Base Catalysis, Kinetic Salt effect, Enzyme Catalysis (Michaelis-Menten Kinetics), Stern-Volmer description, Electrochemical Kinetics; Kinetics of the Hydration of CO2.
3. Relation Between Diffusion and Brownian Motion, Thermodynamic view of diffusion, diffusion equation, diffusion probabilities, Statistical view of diffusion, Random walk, Einstein-Smoluchowski equation, Ion conductivities and ion-ion interaction, expression for diffusion in terms of force autocorrelation and velocity auto-correlation functions.

4. Kramers’ theory for simple chemical reaction in liquid, energy and diffusion dominated regimes, viscosity (friction dependence); Breakdown of Kramers’ theory as revealed by time domain laser spectroscopy, fractional viscosity dependence of cis-trans isomerization of stilbene. Grote-Hynes Theory for the observed fractional viscosity dependence and the related debate.

References and Books:
5. R. A. Alberty and R. J. Silbey, Physical Chemistry, John Wiley and Sons

CB 533: LIQUIDS
A. Thermodynamics of liquids
1. Mean field theory of liquids
2. Density functional theory
3. Dynamics: correlation function (dfn), conservation laws and diffusive motion
4. Basic Computer simulation: MC, MD and BD

B. Applications of liquid theory in chemistry
1. Basic ideas of absorption and fluorescence response of a dissolved solute, Relation between interaction and line-width
2. Connection between molecular motions in a liquid solvent and fluorescence and dielectric response; complexities associated with conducting liquids
3. Time-resolved measurements of reactive and non-reactive dynamics in liquids and their statistical mechanical (time-dependent) interpretations; confinement effects
4. Concept of friction, diffusive motions and experimental realizations
5. Heterogeneity (spatial and temporal) in liquids and its relation to non-hydrodynamic behavior: reflections from experiments, simulations and theory.

CB 535: NON-EQUILIBRIUM STATISTICAL MECHANICS
1. Stochastic Processes and Transition Probability; Random Walk: Master Equation of diffusion over a lattice; Time dependent correlation function, response function, Linear
response and susceptibility with illustration via harmonic oscillators; Fluctuation-Dissipation theorem.

2. Slow and fast degrees of freedom: Illustration via damped harmonic oscillator; Elementary idea of elimination of fast degree of freedom and noise; Langevin Equation of motion of Brownian particle and calculation of different correlation functions; Over damped dynamics with illustration from the Rouse Model of polymer chain.

CB 540: STUDY OF BIO-MACROMOLECULES

The course content includes the following topics:

a. Introduction to macromolecules
   1. Amino Acids and their structures
   2. Nucleotides and their structures
   3. Proteins
   4. Nucleic acids

b. Biophysical characterization of macromolecules
   1. Optical Spectroscopy
   2. Fluorescence Spectroscopy
   3. Mass Spectrometry
   4. NMR Spectroscopy

c. Structural characterization of macromolecules
   1. X-ray Crystallography
   2. NMR Spectroscopy
   3. Mass Spectrometry

d. Biochemical Studies of macromolecules
   1. Protein Folding
   2. Genetic Modification and oxidative stress
   3. Role of water in biomolecules
   4. Enzymes: polymerase, nuclease etc.

Reference books:

1. Proteins: Structures and Molecular Properties by Thomas E. Creighton
2. Introduction to protein structure: Branden and Tooze
3. Crystallography made crystal clear: Gale Rhodes
4. Principles of nucleic acid structure: Stephen Neidle
5. Structure and Mechanism in Protein Science: A guide to enzyme catalysis and protein folding: Alan Fersht

CB 591: PROJECT RESEARCH (SEMESTER – I)
CB 592: PROJECT RESEARCH (CONTINUED IN SEMESTER – II)

BISWAJIT CHAKRABORTY
PROFESSOR & DEAN (ACADEMIC PROGRAMME)
S N BOSE NATIONAL CENTRE FOR BASIC SCIENCES
PhD in Natural Science programs can be found at many universities throughout the world, but those that have strong science programs are the best choices. Use the search below to find a program that will work for your needs. Other options within this field of study:

- **QUB Faculty of Engineering and Physical Sciences (EPS), Belfast, United Kingdom.** The research undertaken within Geography falls under two interdisciplinary Research Clusters; Environmental Change & Resilience (ECR) and Culture & Society (C&S).

- **PhD program in the graduate field of Applied Physics (AP) provides students with mastery of a broad knowledge base in applied physics, as well as advanced research focus.**

- **The Ph.D. in Engineering Physics offers exciting opportunities to build upon the research that is being carried out in the Department of Physical Sciences including remote sensing, and the design and implementation of electro-optical and radar systems.**

- **The objective of the Ph.D. program in Engineering Physics is to provide advanced education and research opportunities to exceptional students by providing a research environment which fosters collaboration, creative thinking and publishing of findings in nationally recognized journals.** Students are involved in all the research, which includes gr Astrophysical Sciences and Technology Doctor of philosophy (Ph.D.) degree. Astrophyiscal Sciences and Technology Doctor of philosophy (Ph.D.) degree.

- **Breadcrumb: RIT.** An astrophysics Ph.D. centered on phenomena beyond the Earth and on the development of the technologies that will enable the next major strides in the field.

- **STEM-OPT Visa Eligible. 100%.** This course will provide the physical background needed to interpret both observations and theoretical models in stellar astrophysics and prepare students for more advanced topics and research in astrophysics.

- **(Prerequisites: This course is restricted to students in the ASTP-MS and ASTP-PHD programs.)**

- **Ph.D. in Physical Chemistry is a 3-year full-time doctorate course. The minimum eligibility for which is a 55% score in the Master's degree pursued from a recognized university. Admission to the course depends on a candidate’s performance in the relative entrance test conducted by the universities followed by a round of personal interview.**

- **The program combines the qualitative and quantitative concepts related to research, development and application of the physical chemistry science. The average tuition fee for Ph.D. in Physical Chemistry course ranges from INR 6000- INR 24,000 per year for three years of study. Such postgraduates get to work in the field of research and teaching, laboratories, nanotechnology, utilities and energy research etc.**
